3. Php bin/magento setup:upgrade
4. Php bin/magento setup:di:compile
5. Php bin/magento setup:static-content:deploy -f

👉 How To Configure AutoApply Couponcode ?

1. Login Into admin >> Stores >> Configuration

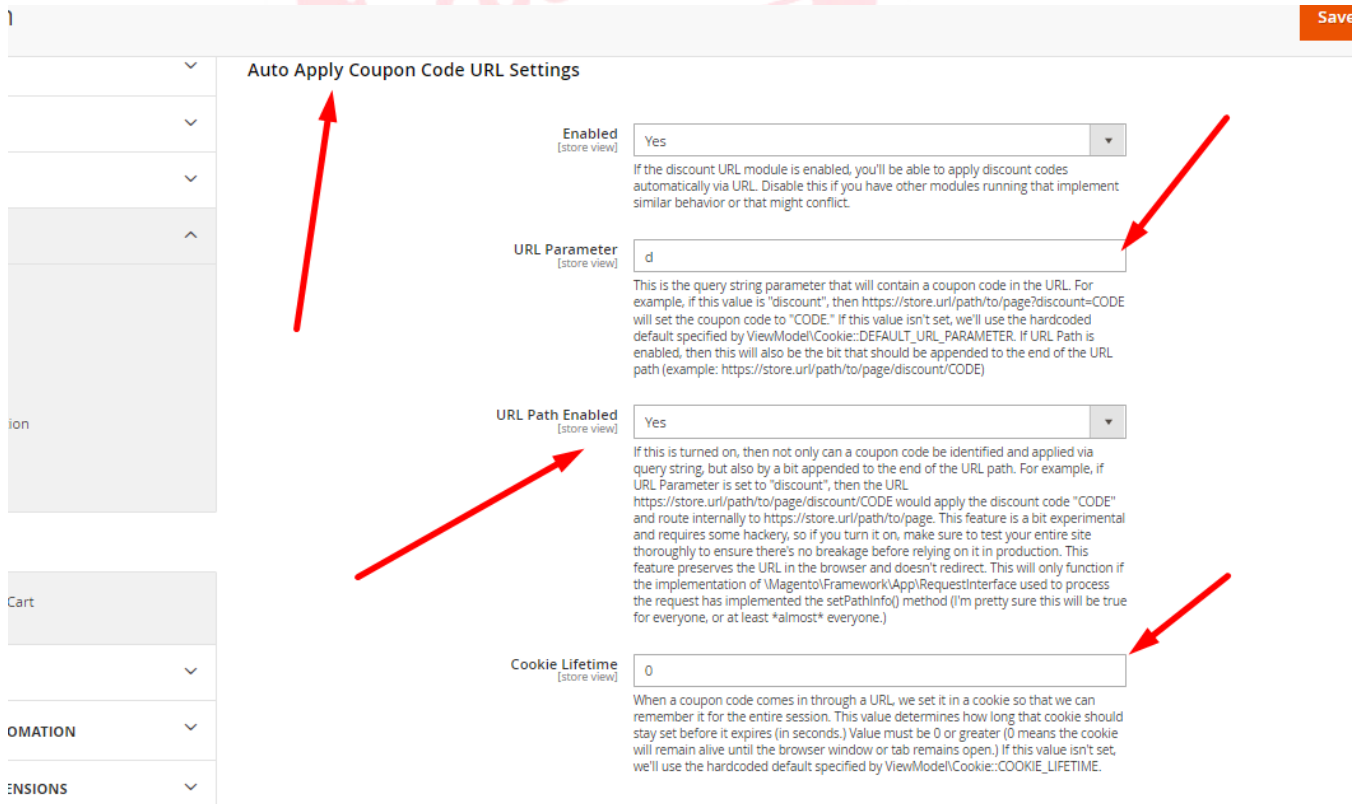

2. Customers >> Promotion

The screenshot shows the Magento Configuration page. On the left is a vertical navigation menu with icons and labels for various system areas: SALES, CATALOG, CUSTOMERS, MARKETING, CONTENT, REPORTS, AIMSINFOSOFT, STORES, SYSTEM, and FIND PARTNERS & EXTENSIONS. The 'CUSTOMERS' section is expanded, showing sub-items: Login as Customer, Newsletter, Customer Configuration, Wish List, Promotions, and Persistent Shopping Cart. The 'Promotions' item is highlighted with a red box and a red arrow pointing to it. The main configuration area on the right has a 'Configuration' header and a 'Save Config' button. It contains several sections: State Options, Locale Options, Store Information, and Single-Store Mode. Each section has a dropdown arrow on the right. A red arrow points from the 'Promotions' item in the menu to the 'State Options' section in the main area.

3. Auto Apply Coupon code url Settings

The screenshot shows the 'Auto Apply Coupon Code URL Settings' configuration page. The page has a 'Save' button in the top right corner. The left sidebar shows the navigation menu with 'Promotions' selected. The main configuration area has the title 'Auto Apply Coupon Code URL Settings'. It contains four settings, each with a dropdown menu and a description:

- Enabled** (store view): Set to 'Yes'. Description: If the discount URL module is enabled, you'll be able to apply discount codes automatically via URL. Disable this if you have other modules running that implement similar behavior or that might conflict.
- URL Parameter** (store view): Set to 'd'. Description: This is the query string parameter that will contain a coupon code in the URL. For example, if this value is "discount", then https://store.url/path/to/page?discount=CODE will set the coupon code to "CODE." If this value isn't set, we'll use the hardcoded default specified by ViewModel\Cookie::DEFAULT_URL_PARAMETER. If URL Path is enabled, then this will also be the bit that should be appended to the end of the URL path (example: https://store.url/path/to/page/discount/CODE).
- URL Path Enabled** (store view): Set to 'Yes'. Description: If this is turned on, then not only can a coupon code be identified and applied via query string, but also by a bit appended to the end of the URL path. For example, if URL Parameter is set to "discount", then the URL https://store.url/path/to/page/discount/CODE would apply the discount code "CODE" and route internally to https://store.url/path/to/page. This feature is a bit experimental and requires some hackery, so if you turn it on, make sure to test your entire site thoroughly to ensure there's no breakage before relying on it in production. This feature preserves the URL in the browser and doesn't redirect. This will only function if the implementation of \Magento\Framework\App\RequestInterface used to process the request has implemented the setPathInfo() method (I'm pretty sure this will be true for everyone, or at least *almost* everyone.)
- Cookie Lifetime** (store view): Set to '0'. Description: When a coupon code comes in through a URL, we set it in a cookie so that we can remember it for the entire session. This value determines how long that cookie should stay set before it expires (in seconds.) Value must be 0 or greater (0 means the cookie will remain alive until the browser window or tab remains open.) If this value isn't set, we'll use the hardcoded default specified by ViewModel\Cookie::COOKIE_LIFETIME.

Red arrows point to each of these four settings.

4.Auto Generated Specific Coupon codes

Cookie Lifetime [store view] 0

When a coupon code comes in through a URL, we set it in a cookie so that we can remember it for the entire session. This value determines how long that cookie should stay set before it expires (in seconds.) Value must be 0 or greater (0 means the cookie will remain alive until the browser window or tab remains open.) If this value isn't set, we'll use the hardcoded default specified by ViewModel\Coupon::COOKIE_LIFETIME.

Auto Generated Specific Coupon Codes

Code Length [global] 12 ☒ Use system value
Excluding prefix, suffix and separators.

Code Format [global] Alphanumeric ☒ Use system value

Code Prefix [global]

Code Suffix [global]

Dash Every X Characters [global]

If empty no separation.
